

Joomla 3.3 Updates

Joomla 3.3 will be released next month with some exciting new features and Joomla is claiming it will be the most stable Joomla platform ever! As beta releases become available we will test Joomla 3.3 on our products as we have done with previous editions of Joomla. As of now we see no issues that will affect our products.

Many of the new features will include security fixes, backend updates, cloud storage API's and much more. You can read more about the update from [here](#).

One of the biggest changes in 3.3 is the conversion of mootools to jquery. We want to ensure our customers that you have absolutely nothing to worry about here with our products. We predicted this changeover when Joomla 3.0 was first introduced with jquery, and we converted all of our mootools scripts over to jquery at that time rather than waiting until now. All of our Joomla 3 products have always been running jquery and do not include mootools at all.
