The S5 Flex Menu system is a very powerful plugin that provides functionality   far beyond what the standard Joomla menu system can provide. This plugin   is intended to be as an extension of the existing menu system in Joomla to add many new features! Please see the full list of features below.

This menu system works off of the core Joomla mootools script so no extra javascript library is needed and keep download sizes to a minimum. Also, if you do not want to use this menu you can simply turn it it off from the template configuration page.
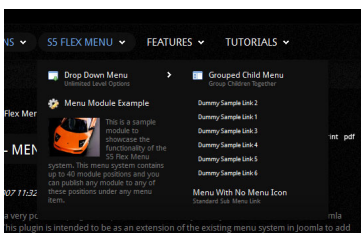

Take your website to the next design level by using the robust and feature rich S5 Flex Menu System. Organize your links with ease and show content   in places you never could before!

Please note - this template does not support sub text on the first level links. However, all sub menus do.

Menu Features:

- Multiple javascript effects with core mootools
- Multiple columns for menu items or modules
- Modules load directly into the menu
- Group sub menu items into the same column or fly out
- Optional sub texts for each menu item
- Optional menu icon images for each menu item
- And much more!
